

# SICO<sup>®</sup>

CLINICAL INFORMATION SYSTEM

Developed in close collaboration between computer engineers and doctors, it facilitates and actively supports the profession of doctors and hospital staff in their daily work.

Your mission is essential for the protection of **patient health**.

**SICO** is the **solution** tailored to facilitate **your daily work**.

### At the service of the doctor and the patient

**SICO** is an information system for the management of all medical and administrative information relating to the patient and provides the medical staff with a global and unified view of the person's health in a simple clear and fast way.

The modularity that characterizes the application allows you to operate with maximum flexibility and comfort in choosing the work style that best suits your needs.

The access of each operator is limited to the information they are responsible for. The patient, through credentials, can also have access to their medical record via the internet and allow their doctor to consult it and possibly update it with specific functions, without modifying the information already present. In this way, the entire clinical history of the patient is entered in a single file that is always and quickly accessible.

### Professionalism and simplicity

An accurate study of the habits of medical staff and the development of the software constantly alongside hospital staff has made it possible to create a particularly well-designed interface to make the use of the software intuitive, simple and quickly learned, much appreciated by those who use it every day.

Despite the considerable amount of information that can be stored, the extreme handling of our software is obtained thanks to a dynamic management of the user interface that allows for a comfortable and practical navigation within the medical records.

The application is compliant with international standards HL7, DICOM, OTA, ICD, LOINC, etc.

### Examine and See

**SICO** is a complete and feature-rich tool for archiving, managing and searching for any type of information, and carrying out administrative procedures.

For each hospital unit, a specific Medical Record has been created with the possibility of customizing it according to the needs of the unit. This has made it possible to create a complete, effective and functional software that adapts to the individual requests of medical and nursing staff while integrating all the patient's clinical data.

To facilitate the entry of data and the completion of the records, they have been enriched with over 5000 images, parameters and cards that still leave freedom of customization and freely introduce clinical information.

**Facilitating** the work of **medical personnel** in every way is **our main goal**.
